Does the app support working with gimbals?

Officially, the application does not support the function of working with stabilizers. Sometimes in the application you can set the functionality of the Start/Stop Recording button on the stabilizer. As the experience of our users from real shooting processes shows, this is more than enough in most cases.

A good approach would be to inquire with owners of your gimbal model about its customization capabilities in our [Telegram chat](), or to install the [free mcpro24fps Demo]() app and personally test the possibility of such customization.
